

Problem ??

Birds damage crops in open farm fields causing huge yield loss. Existing Methods are ineffective

Scarecrows

Not Effective

USING WIND ENERGY

*Eagle Decoy Model

- Wing Flapping effect + Sound effect
- ↳ Flapping wings at intervals
- ↳ plays Eagle sounds at random intervals
- Results birds flow away from farm field

Monitoring & IoT Unit

- ESP32 CAM module
 - ↳ provides live Monitoring of Farm area
- Wi-Fi Connectivity
 - ↳ Transmits real time video to cloud/app
- IoT Dashboard/Mobile App
 - ↳ Shows live video feed
 - ↳ Allows ON/OFF control system

Proposed Solution

A Rotating Eagle model powered by renewable energy, defend birds safely (without harming birds)

Future Scope

Features

- ESP32 CAM
- IoT Based Control
- Wind power generation
- Eco-Friendly & Non-Harmful
- Rotating Eagle design with sound & wing
- Soil moisture sensor for alert (when soil dries)

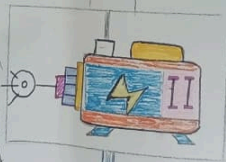

- Add Shoot Sound for animals
- Add AI-Based Bird detection
- Cloud Monitoring
- Night vision (24x7 monitoring)
- Develop compact and low cost version for small farmers

Mobile operations

ON OFF

Rotates using Wind Energy

Rotates using charged Energy

Rotation & Motion Unit

- Rotational Motor - fixed in the middle of the field

Power & Control unit

- Wind Energy Generator
 - ↳ Supplies renewable power
- Battery Storage
 - ↳ Stores Energy
- Power Management Module
